

MagikLayout

A fluid, high-intensity three-minute narration built around one causal story

OLD CUT	FLUID CUT
Eight self-contained takes repeatedly restart the explanation.	Each scene answers the question created by the scene before it.
About 550 words plus pauses creates rushed delivery or timeline drift.	Approximately 390 spoken words, with deliberate space for proof shots.
Feature tour: Playground, Classroom, Challenge, Coach, AR.	Narrative spine: disappearance → rule → competence → repair → proof → transfer.

The dramatic spine

1	A button disappears	Create the mystery
2	The rule is revealed	Make the failure intelligible
3	The learner repairs the structure	Deliver the transformation
4	The engine tests understanding	Prove it is not theatre
5	The coach scaffolds; AR transfers	Show pedagogy and innovation
6	Return to SOUTH	End with a changed mental model

Performance rule

Speak as if you are solving one mystery in real time. Do not announce sections. Do not say “next.” Let the final sentence of each beat cause the next image to appear.

Continuous narration - 3:00 master

Read only the orange-accented narration blocks. Visual and edit notes are for the editor. Timing includes short proof holds.

0:00-0:16 · HOOK / THE DISAPPEARANCE

VISUAL Empty Playground. Drop Save, then Cancel, into SOUTH. Hold on one visible button, the hidden chip, and two SOUTH lines in Java.

One line of code. No error. Yet Save has vanished. In Java Swing, the most dangerous bugs are not always broken code. Sometimes they are invisible rules being obeyed perfectly.

EDIT BRIDGE Begin over the empty frame. Let “vanished” land exactly when Save disappears. Cut dead air after the second drop.
ON-SCREEN TEXT NO ERROR. ONE BUTTON MISSING.

0:16-0:36 · PROBLEM / REVEAL THE RULE

VISUAL Pointer traces Cancel, hidden Save chip, then both BorderLayout.SOUTH statements.

Both buttons were sent to SOUTH. But SOUTH is not a row; it is a single seat. Cancel arrived last, so it covered Save. The program did exactly what BorderLayout demanded. The learner simply could not see the rule.

EDIT BRIDGE On “could not see,” match-cut from the hidden chip to the Classroom learning outcome.
ON-SCREEN TEXT SOUTH = ONE DIRECT COMPONENT

0:36-0:55 · PURPOSE / TURN FAILURE INTO COMPETENCE

VISUAL Classroom: NOSS code, Learning Outcome, and BL-SOUTH-COLLISION in one readable frame.

So MagikLayout does more than expose a failure. It turns that moment into a competency: aligned to NOSS IT-010-3:2016-C01, learners predict, test, diagnose, and repair the SOUTH collision. From this point, every screen answers one question: can the learner prove why?

EDIT BRIDGE Start the next sentence before the cut to Playground. This J-cut makes Classroom feel like the reason for the engine demonstration.
ON-SCREEN TEXT PREDICT → TEST → DIAGNOSE → REPAIR

0:55-1:13 · CONCEPT / THE RULES MOVE

VISUAL Switch FlowLayout, GridLayout, BorderLayout; resize the frame while Java remains visible.

Change the manager, and the rule changes instantly. FlowLayout packs a row. GridLayout equalises cells. BorderLayout protects five regions. Resize the frame, and the canvas and Java respond together. This is not a slide explaining behaviour. It is behaviour, live.

EDIT BRIDGE Cut each manager switch on the click. Keep the resize continuous; remove any frozen pointer or failed selection.
ON-SCREEN TEXT ONE ACTION. VISIBLE RULE. LIVE JAVA.

Continuous narration - continued

1:13-1:40 · REPAIR / CHANGE THE STRUCTURE

VISUAL Reset. Drop JPanel into SOUTH. Add two buttons, rename Save and Cancel, then point to panel.add and frame.add(panel, SOUTH).

Now we repair the cause, not the symptom. Place one JPanel in SOUTH. Inside it, FlowLayout gives Save and Cancel room to coexist. BorderLayout sees one component; the learner sees two controls. And the generated Java tells the same story: buttons enter the panel, then the panel enters SOUTH.

EDIT BRIDGE Use a restrained rise in music as both buttons appear. Hold one full second on frame.add(panel, BorderLayout.SOUTH).

ON-SCREEN TEXT ONE REGION → ONE CONTAINER → TWO CONTROLS

1:40-1:58 · PROOF / LET THE ENGINE DISAGREE

VISUAL Reflow Challenge. Lock the untouched prediction. Hold on the offset verdict and “BorderLayout stretches SOUTH”.

But understanding must survive outside the demonstration. The learner locks a prediction. The engine measures the exact offset and exposes the assumption that failed. No AI decides the score. The layout engine establishes the truth first.

EDIT BRIDGE Begin “Only after that truth...” while the verdict is still visible, then cut to Coach Lab.

ON-SCREEN TEXT THE ENGINE JUDGES.

1:58-2:27 · COACH / HELP WITHOUT HIJACKING JUDGEMENT

VISUAL Coach Lab in BM. Show BL-SOUTH-COLLISION, Level 1, Retrieved/Cited chips, withheld rung, retry, then Level 2.

Only after that truth is established does the coach intervene. Level One nudges in Bahasa Malaysia. Retrieved and Cited chips expose the approved source. Ask again too soon, and the ladder refuses; the learner must try. After the retry, Level Two unlocks a deeper explanation. The support is progressive, sourced, and auditable. AI may compose the language, but it never invents the verdict.

EDIT BRIDGE Do not read the full hint aloud. Let the source chips carry the proof. Cut on “beyond the screen” to the AR target.

ON-SCREEN TEXT ENGINE → RETRIEVE → HINT → RETRY

2:27-2:43 · TRANSFER / MOVE BEYOND THE SCREEN

VISUAL AR Lab BM: NOSS, CU, Work Activity, outcomes, original target card.

And once the rule is understood on screen, it must transfer beyond the screen. The AR Lab anchors the same prototype to a target card, preserving the same NOSS outcome: construct, test, diagnose, and repair in a spatial activity.

EDIT BRIDGE Use the target card as a visual wipe or fast push. Return to Playground on the word “return.”

ON-SCREEN TEXT SAME COMPETENCY. NEW CONTEXT.

2:43-3:00 · REFLECTION / RETURN TRANSFORMED

VISUAL Repaired Playground: JPanel selected, FlowLayout visible, Save and Cancel together, Java proof on the right. Final four-second hold.

Now return to where we began: the same SOUTH, but a different structure. What changed was not the buttons. It was the learner's mental model. MagikLayout turns an invisible rule into visible evidence: action, verdict, sourced guidance, repair, and transfer. If two controls must share SOUTH, what will you build - and why?

EDIT BRIDGE Music cuts beneath the question. Hold four seconds. No cursor movement. Fade only after the Java proof has been readable.

ON-SCREEN TEXT MAKE THE INVISIBLE VISIBLE.

Edit and performance map

Problem	Fix in the recorded cut
Navigation feels like a reset	Use J-cuts: begin the next idea 6-10 frames before the route changes. The spoken logic should pull the viewer into the new screen.
Mouse pauses reveal automation latency	Remove static gaps longer than 0.4 seconds. Speed routine drags and route transitions to 115-130%; keep verdict, source chips, Java proof, and the final frame at normal speed.
Every feature has equal weight	Give the longest holds to three proof shots only: the hidden collision, the engine verdict, and the repaired Java structure.
Dialogue sounds like a feature list	Stress contrast pairs: "valid code / vanished button," "one component / two controls," "engine judges / coach explains," "same SOUTH / different structure."
AR feels appended	Enter AR with the transfer line and exit on "return." Keep it concise unless stable tracked-camera footage is available.

Voice direction

0:00-0:36	Controlled urgency. Short phrases. Let "Save has vanished" and "single seat" strike cleanly.
0:36-1:40	Confident discovery. Accelerate slightly through manager changes; slow down for the JPanel repair.
1:40-2:27	Forensic precision. Emphasise exact offset, truth, Retrieved, Cited, and auditable.
2:27-3:00	Broaden, then become intimate. Drop the music before the reflection question and leave four seconds of silence.

Timing check

Spoken copy: approximately 392 words. At 135-145 words per minute, the voice-over occupies about 2:35-2:48, leaving 12-25 seconds for the collision, verdict, code, source-chip, and final reflection holds.

Claim discipline

The recorded Coach Lab is deterministic and corpus-grounded. Say that AI may compose language when enabled; do not imply that AI graded the challenge. Present AR as a transfer activity and prototype unless classroom validation evidence is shown.
