

MAGIKLAYOUT

Make the invisible rule visible.

A child-clear, judge-convincing storyboard with word-for-word English narration

Two buttons enter SOUTH. Only one can be seen.	A JPanel becomes a bench: one seat, two buttons.	The engine judges. Haiku explains.	The repair is recorded as classroom evidence.

MASTER DURATION 3:45 | FORMAT 16:9 / 1080p | ONE CONCEPT BorderLayout SOUTH collision

Design test: if a Year 5 learner can retell the story as ‘one chair, one bench, two buttons’, the film is clear enough. Technical names remain on screen so assessors still see NOSS accuracy and engineering depth.

1. The new story rule

More detail in the production plan; less cognitive load in the film.

ONE QUESTION	Why did Save disappear even though the code had no error?
ONE ANALOGY	A BorderLayout frame is a house with five named spaces. SOUTH is one seat, not a row.
ONE REPAIR	Put one JPanel in SOUTH. The panel acts like a bench and arranges Save + Cancel inside it.
ONE AI JOB	Claude Haiku never decides correctness. It turns approved evidence into a short question that helps the learner think.
ONE ENDING	The learner explains why the bench works. Understanding - not button placement - is the transformation.

What must be removed from the old cut

REMOVE	REPLACE WITH	WHY
Four surfaces shown as equal features	One SOUTH story; other screens appear only as evidence	A child follows cause and effect, not a product tour
Technical pipeline spoken as a list	Referee -> library -> helper -> gatekeeper	The picture carries the meaning; technical labels remain for judges
Long mouse travel and setup	Pre-positioned states and match cuts	OBS records learning moments, not administration
Claims before proof	Show the engine verdict first, then show Haiku	The sequence itself proves ethical AI

2. Visual vocabulary: explain hard ideas without dumbing them down

Use the friendly metaphor in narration; preserve the precise computing term as a small caption.

SCREEN LABEL	CHILD-CLEAR PICTURE	JUDGE-LEVEL MEANING
FRAME	A small house	The JFrame content pane
NORTH / SOUTH / EAST / WEST / CENTER	Five named spaces	BorderLayout regions
SOUTH	One chair	One direct component per region
JPanel + FlowLayout	A bench holding two friends	A nested container arranges multiple children
DETERMINISTIC ENGINE	The referee	Calculates layout and correctness without AI
RETRIEVAL	The approved library	Selects reviewed bilingual passages by misconception and hint level
CLAUDE HAIKU 4.5	The helpful teacher's voice	Composes a short Socratic hint from supplied evidence
GUARD	The gatekeeper	Rejects invalid citations, leakage, contradictions, wrong language or length

Language control

No sentence should introduce more than one new idea. Prefer concrete verbs: enter, disappear, sit, carry, check, ask. Delay terms such as deterministic, retrieval and contradiction until the audience has already seen their visual equivalent.

3. Storyboard A - mystery, meaning, mission

Every row is a shooting instruction. Narration is spoken exactly; all other text is production guidance.

SCENE / TIME	WORD-FOR-WORD NARRATION	BROWSER + VISUAL ACTION	TEXT / AUDIO / PASS TEST
01 - The magic trick 0:00-0:15 HOOK	Two buttons enter the bottom of this window: Save, then Cancel. The code runs. No red error. But look closely - where did Save go?	Action Start on a clean Playground already set to BorderLayout. Add or reveal Save in SOUTH. Add Cancel to SOUTH. Freeze the pointer beside the single visible button. Frame Canvas and two generated frame.add(..., SOUTH) lines remain readable together.	On screen NO ERROR. ONE BUTTON MISSING. Sound Single soft click per add. Music stops for 0.5 s after the question. Pass A viewer can point to the missing button before any explanation begins.
02 - One chair 0:15-0:32 PROBLEM	Imagine the window as a tiny house with five named spaces. SOUTH is the space at the bottom. But SOUTH has only one chair. Cancel arrived last, so Save lost its seat.	Action Overlay a simple five-space diagram on the live frame. Highlight SOUTH orange. Animate one chair; place Save, then replace it with Cancel. Frame Keep the application visible beneath a 35% transparent overlay. Do not cut away to a full-screen cartoon.	On screen SOUTH = ONE DIRECT COMPONENT Sound Warm explanatory tone. Land 'one chair' slowly. Pass A child can answer: Cancel is visible because it arrived last.
03 - The mission 0:32-0:49 OUTCOME	Our mission is simple: keep both buttons visible, and explain why the repair works. This is a real TVET skill aligned to NOSS IT-010-3:2016-C01.	Action Match-cut to Classroom Lesson Pack. Hold the NOSS code, learning outcome, and BL-SOUTH-COLLISION in the same frame. Frame Use a subtle crop or zoom so the outcome is readable at 1080p.	On screen PREDICT -> TEST -> EXPLAIN -> REPAIR Sound Confident, not bureaucratic. Do not read the entire formal outcome. Pass The judge hears one measurable skill; the child hears one mission.

4. Storyboard B - repair, prediction, referee

Every row is a shooting instruction. Narration is spoken exactly; all other text is production guidance.

SCENE / TIME	WORD-FOR-WORD NARRATION	BROWSER + VISUAL ACTION	TEXT / AUDIO / PASS TEST
04 - Build a bench 0:49-1:17 CONCEPT + EXAMPLE	We do not need another chair. We need one bench. A JPanel becomes that bench. Put Save and Cancel inside the panel, then place the single panel in SOUTH. BorderLayout sees one component. We still see two buttons.	Action Return to a prepared Playground state. Reveal JPanel in SOUTH. Reveal Save and Cancel inside it. Pointer traces button -> panel -> SOUTH. Avoid constructing from scratch on camera. Frame Panel boundary pulses once. Show panel.add(Save), panel.add(Cancel), then frame.add(panel, SOUTH).	On screen ONE REGION -> ONE CONTAINER -> TWO BUTTONS Sound Small music rise when both buttons become visible. Pass A child can retell: the bench fits in one seat and carries two buttons.
05 - Test the rule 1:17-1:35 ACTIVE LEARNING	Now make a prediction. If the window becomes wider, will the buttons disappear again? Choose your answer before we resize.	Action Cut to the reflow challenge with prediction ready. Hold 2 s. Lock the prediction, then resize or reveal the target position. Frame Ghost position and final position must both be visible. Keep cursor still during the thinking pause.	On screen PAUSE. PREDICT FIRST. Sound Leave two full seconds of silence for viewer participation. Pass The viewer has time to form an answer before the app reveals one.
06 - The referee 1:35-1:55 DETERMINISTIC PROOF	The layout engine checks the structure and the exact movement. It is our referee. It decides what happened from the same rules that draw the screen. No AI decides this score.	Action Show the challenge verdict or Coach Lab engine finding for BL-SOUTH-COLLISION. Highlight the finding before any hint button is pressed. Frame Add a small 'REFEREE' label beside the engine finding. Do not display the AI pipeline yet.	On screen THE ENGINE JUDGES. Sound Firm, factual cadence. Drop the music under 'No AI'. Pass Sequence proves the verdict existed before Haiku was called.

5. Storyboard C - where Claude Haiku actually enters

Every row is a shooting instruction. Narration is spoken exactly; all other text is production guidance.

SCENE / TIME	WORD-FOR-WORD NARRATION	BROWSER + VISUAL ACTION	TEXT / AUDIO / PASS TEST
07 - Ask the library 1:55-2:15 RETRIEVAL	Only after the referee speaks do we ask for help. First, MagikLayout visits an approved library. It selects two short notes for this exact mistake and this hint level.	Action Open Coach Lab with 'AI on - coach-rag'. Keep BL-SOUTH-COLLISION visible. Press Ask for a hint. Animate Engine -> Approved Library while the request is processing. Frame Retrieved source chips appear as the visual proof. Use their real IDs; never invent a citation.	On screen 1. ENGINE -> 2. APPROVED LIBRARY Sound A quiet page-turn sound may mark retrieval; no science-fiction effects. Pass Viewer understands that approved information is selected before AI writes.
08 - Haiku finds the words 2:15-2:42 AI VALUE	Now Claude Haiku 4.5 enters - not as the referee, but as a helpful teacher's voice. It receives the finding and those approved notes. It writes one short question: enough to guide thinking, never enough to give away the repair.	Action Reveal Haiku only at the Compose stage. Hold the generated Level 1 hint. Pointer does not move while the audience reads the first sentence. Frame Pipeline overlay: Engine -> Retrieve -> Haiku 4.5. Keep real hint visible behind it.	On screen HAIKU EXPLAINS. IT DOES NOT GRADE. Sound Human, reassuring voice. Slow down on 'not as the referee'. Pass A child can answer: Haiku helps with words; the engine decides correctness.
09 - The gatekeeper 2:42-3:02 ETHICAL AI	Before the hint reaches a learner, a gatekeeper checks it. Are the sources real? Is the language correct? Did it reveal the answer or disagree with the engine? Only a safe hint may pass.	Action Reveal 'Model composed - guard passed', then Retrieved and Cited IDs. Animate a gate opening only after all checks tick green. Frame Use five compact checks: source, language, length, no answer leak, no contradiction.	On screen GUARD CHECKED. SAFE TO SERVE. Sound Five restrained ticks, then silence. Do not claim the model can never fail. Pass Judge sees explicit ethical controls; child understands a safety check happens.

6. Storyboard D - access, evidence, reflection

Every row is a shooting instruction. Narration is spoken exactly; all other text is production guidance.

SCENE / TIME	WORD-FOR-WORD NARRATION	BROWSER + VISUAL ACTION	TEXT / AUDIO / PASS TEST
10 - Speak my language 3:02-3:19 ACCESS	The same help can speak in Bahasa Malaysia. The rule stays true; only the explanation changes. And if the network fails, reviewed library text still answers.	Action Toggle BM and show a fresh Level 1 hint. Briefly caption the safe fallback; do not simulate a network failure in the main take. Frame BM hint plus matching Retrieved/Cited IDs. Keep technical Swing terms in English.	On screen SAME RULE. THE LEARNER'S LANGUAGE. Sound Warm and inclusive. No music swell. Pass Bilingual value is visible without opening a second storyline.
11 - Evidence, not applause 3:19-3:34 IMPACT	The teacher sees attempts, hints and successful repairs - without student names. The evidence comes from the layout engine, not from the model.	Action Cut to Class Session. Show anonymous learner label, repair rate, hints served, and BL-SOUTH-COLLISION frequency. Refresh once only. Frame Crop to the cohort summary. Avoid claiming learning gains from an unrun classroom pilot.	On screen ANONYMOUS. MEASURABLE. TEACHER-READY. Sound Matter-of-fact close to the proof sequence. Pass Judge sees usable classroom evidence and privacy discipline.
12 - Return to the mystery 3:34-3:45 SUMMARY + REFLECTION	Save never needed magic. It needed the right structure. MagikLayout makes the hidden rule visible, then lets AI help without taking control. If two buttons must share SOUTH, what will you build - and why?	Action Match-cut back to the repaired frame. Hold JPanel selected, both buttons visible, and Java proof readable for four seconds. Frame No cursor movement. Fade after the question, not before.	On screen MAKE THE INVISIBLE VISIBLE. Sound Music resolves, then stops beneath the final question. Four-second silence. Pass A child answers 'a panel/bench, because SOUTH accepts one component'.

7. Continuous English narration - clean recording copy

Approx. 400 words. Read at 112-120 words per minute. Do not announce scene names. The pauses are part of the teaching.

0:00 Two buttons enter the bottom of this window: Save, then Cancel. The code runs. No red error. But look closely - where did Save go? Imagine the window as a tiny house with five named spaces. SOUTH is the space at the bottom. But SOUTH has only one chair. Cancel arrived last, so Save lost its seat. Our mission is simple: keep both buttons visible, and explain why the repair works. This is a real TVET skill aligned to NOSS IT-010-3:2016-C01.

0:49 We do not need another chair. We need one bench. A JPanel becomes that bench. Put Save and Cancel inside the panel, then place the single panel in SOUTH. BorderLayout sees one component. We still see two buttons. Now make a prediction. If the window becomes wider, will the buttons disappear again? Choose your answer before we resize. The layout engine checks the structure and the exact movement. It is our referee. It decides what happened from the same rules that draw the screen. No AI decides this score.

1:55 Only after the referee speaks do we ask for help. First, MagikLayout visits an approved library. It selects two short notes for this exact mistake and this hint level. Now Claude Haiku 4.5 enters - not as the referee, but as a helpful teacher's voice. It receives the finding and those approved notes. It writes one short question: enough to guide thinking, never enough to give away the repair. Before the hint reaches a learner, a gatekeeper checks it. Are the sources real? Is the language correct? Did it reveal the answer or disagree with the engine? Only a safe hint may pass.

3:02 The same help can speak in Bahasa Malaysia. The rule stays true; only the explanation changes. And if the network fails, reviewed library text still answers. The teacher sees attempts, hints and successful repairs - without student names. The evidence comes from the layout engine, not from the model. Save never needed magic. It needed the right structure. MagikLayout makes the hidden rule visible, then lets AI help without taking control. If two buttons must share SOUTH, what will you build - and why?

Performance direction

Start with wonder, not urgency. Become playful on 'one chair' and 'one bench'. Become precise at the referee. Slow deliberately when naming Claude Haiku 4.5. Finish the reflection question as a teacher speaking to one learner, not as an advertisement.

8. The judge-proof AI explanation

This page is for rehearsal and Q&A.; The film uses the child-clear metaphor; the presenter must also command the exact architecture.

STAGE	FILM METAPHOR	TECHNICAL AUTHORITY	AI?
1. ENGINE	Referee	Deterministically diagnoses BL-SOUTH-COLLISION and emits factual findings.	No
2. RETRIEVE	Approved library	Selects reviewed bilingual passages for the misconception and permitted hint level.	No
3. HAIKU	Helpful voice	claude-haiku-4-5 composes one short Socratic hint and cites supplied chunk IDs.	YES
4. GUARD	Gatekeeper	Checks citation validity, language, length, answer leakage and contradiction.	No
5. SERVE + LOG	Delivery record	Serves only approved output; records retrieved IDs, cited IDs, model, latency and outcome.	No

SAFE JUDGE-FACING LINE

Claude Haiku 4.5 does not decide whether a learner is correct. It composes a bilingual Socratic hint from reviewed passages already selected by retrieval, and the hint is served only after a deterministic guard validates it.

Rubric coverage inside the story

20% PdP design	One NOSS objective + induction + concept + prediction + repair + reflection	20% AI integration	Haiku adds explanation after deterministic truth
10% innovation	Faithful live layout engine and governed AI pipeline	10% impact	Anonymous attempts, hints and repair evidence
5% ethics	Subordinate AI, guard, citations, fallback and no model grading	10% video	One clear story, readable proof shots and timed reflection

9. OBS and browser production plan

The best take is prepared, not improvised. Record short clean states, then edit them into one continuous cause-and-effect story.

PREP 1	Set Chrome to 100% zoom; hide bookmarks; close notifications; use one 16:9 browser window.
PREP 2	Prepare four tabs/states only: collision, repaired Playground, Coach Lab reset, active Class Session.
PREP 3	Verify public badge reads AI on - coach-rag. Run one hidden preflight hint before recording.
PREP 4	OBS: 1920x1080 canvas/output, 30 or 60 fps, microphone peaking near -9 dB, desktop alerts disabled.
PREP 5	Record narration separately if possible. Browser motion should follow the voice, not force the voice to chase loading time.

Autopilot pacing rules

MOMENT	HOLD	RULE
Button disappears	2.0 s	Freeze cursor; let the audience discover the contradiction
Prediction question	2.0 s	No clicking during thinking time
Engine verdict	3.0 s	Must appear before Ask for a hint
Haiku hint	5.0 s	First sentence and Model composed - guard passed must be readable
Retrieved + Cited	3.0 s	Real IDs in frame; no decorative fake citation
Final repair	4.0 s	No cursor movement beneath the reflection question

Editing bridges

Use only three transitions: match cut (SOUTH to learning outcome), J-cut (voice begins before Coach Lab appears), and return cut (class evidence back to repaired SOUTH). Remove loading gaps, but never shorten proof holds. Avoid AR in this 3:45 master; it opens a second mental model and weakens the one-concept rubric focus.

10. Final acceptance checklist

Do not submit merely because the recording is smooth. Submit when every item below is visible or audible.

☐	CHILD CLARITY	A viewer can explain the disappearance using 'one chair' and the repair using 'one bench'.
☐	ONE OBJECTIVE	The NOSS code and the single repair goal appear once, clearly, for at least three seconds.
☐	ACTIVE LEARNING	The prediction question includes a real two-second thinking pause.
☐	ENGINE FIRST	BL-SOUTH-COLLISION and factual findings are visible before any AI request.
☐	HAIKU PROOF	AI on - coach-rag, Model composed - guard passed, Retrieved IDs and Cited IDs are visible.
☐	ETHICAL CLAIM	Narration states that Haiku explains but does not grade; the guard is explained.
☐	BILINGUAL VALUE	A BM hint appears without changing the underlying engine finding.
☐	CLASSROOM USE	Anonymous attempts, hints and repair evidence appear; no names or invented pilot results.
☐	TECHNICAL QUALITY	16:9, minimum 1080p, clean cursor path, clear captions, stable audio, 3-5 minutes.
☐	REFLECTION	The film ends with: 'If two buttons must share SOUTH, what will you build - and why?'

THE TEST

After watching once, ask a non-programmer: 'Why did Save disappear, what fixed it, and what did Haiku do?' A winning cut produces three answers: 'one SOUTH seat', 'a JPanel bench', and 'Haiku explained the referee's finding'. If any answer is missing, revise the film - not the learner.
